

SUCCESS STORY

Burlington House – an award-winning project with 2N technology

CHALLENGE

Burlington House is an exclusive new-built project located in the heart of Manchester. This stunning property consists of a total of **91 luxury waterfront apartments set over 11 floors**. As Burlington House is the residential benchmark in digital connectivity, sealed by a prestigious **WiredScore Silver rating**, everything has been thought through in detail. When the Leeds-based property investor Town Centre Securities PLC began planning construction, they focused in particular on **high-end design** and the latest **‘smart technology’ features**. As a result, **Security Design**, the integrator and our partner, defined the following requirements:

A scalable access control system with smart features

High-quality design and exclusivity

Reliable and innovative IP access units with the latest Bluetooth technology

Ease of administration, configuration and installation

A cost-effective solution

CONVENIENT AND SECURE ACCESS

The 2N keyless entry solution is simple to use; tenants can securely access their apartment using the 2N® Mobile Key app on their smartphone. Once their mobile device is synced, they can simply touch the outdoor module to gain entry.

SIMPLE ADMINISTRATION

The configuration and management of the complete access system is ensured by 2N® Access Commander and can be done remotely. Through the graphical user interface, access permissions and specific functions are set in bulk, such as who has access to specific doors.

SEAMLESS INTEGRATION

Thanks to the integration of the 2N access solution with other systems, tenants can enjoy all the functions of their smart apartment from one interface, including answering visitors, opening doors and receiving notifications.

When we were reviewing what was in the marketplace for this exclusive project in Manchester, UK, our main focus was finding an already proven, reliable solution with high-end design. Recently, we had heard a lot about 2N therefore decided to come and see what they had to offer for ourselves. In short, they met all of our requirements and exceeded our expectations in terms of functionality and administration ease.

Steve Bartrum
Integrator Security Design

We are delighted that Burlington House is the first residential development in Manchester to achieve a WiredScore Home rating for its digital connectivity. As well as the unique amenities on offer, our tenants benefit from the knowledge that their homes have the best possible level of connectivity – including a unique mobile access solution.

Edward Ziff

SOLUTION

2N® IP VERSO

The sleek looking 2N® IP Verso audio-visual intercom was selected for the front door as it offers unique modularity, luxury design and enhances capabilities. The intercom has a digital touchscreen display with Bluetooth/RFID readers and a Touch Keypad, therefore using the modularity exactly according to the user requirements. In addition to the RFID cards, a mobile phone can be used for identification.

Residents only need the 2N® Mobile Key app on their smartphones. The user can then enter the door by pressing a button in the app, or at the touch of a reader.

2N ACCESS UNITS

2N Access Units with Bluetooth were installed at the doors to each apartment, including the package room, bike room and car park. This solution allows each tenant to use their mobile phone as a means of identification to gain entry throughout the residential complex.

2N® INDOOR TOUCH

2N® Indoor Touch answering units were installed in all of the apartments. The stylish internal communicator has an impressive 7" colour touchscreen display with resistant glass protection and the ability to integrate with home automation systems.

Tenants can control not only communication with visitors at the door and access, they can also manage their air-conditioning systems, lighting, CCTV cameras and blinds. The home screen can even display the current weather forecast.

2N® MOBILE KEY

When a courier or vendor arrives at the front door, a digital message on the Verso home screen directs them to a special button that sends a video alert to Burlington House's concierge service. When the concierge service answers the call, they can visually verify the individual through the intercom camera before unlocking the front door. The concierge can then unlock the door to the package room so the courier can securely store the delivery. At the same time, the concierge sends a message to the intended recipient letting them know that they have a package waiting.

The 2N access system ensures quality protection for our residential complex. As a system administrator, simplicity of use was my main focus. 2N Access Commander is a well-designed system that allows the status of devices in the access control system to be monitored in real time. We appreciate the wide range of options offered by the application interface, which allows us to link and update the access components with other technologies in the building.
